

Hi,

I have constructed a 'table' by using a pair of nested repeating groups.

My problem is that the XML output is "sparse". That is, empty cells do NOT produce empty XML tags.

So, when I find "tic" as a value, I do not know what column it came from.

Also, it seems that the order of the cells is not maintained. "tac" comes before "tic", even though it is right of it.

A perfect solution would be to output the numbers in parenthesis (red arrows) as XML elements, along with the value.

Question:

What is your suggestion for passing the row/column location of the cell to the XML output?

Thx,

M.

```
<_NonW2Rows>
  <_LineNbr>24 From SCHEDULE E Attached</_LineNbr>
  <_NonW2Columns>
    <_NonW2Income>tac</_NonW2Income>
  </_NonW2Columns>
  <_NonW2Columns>
    <_NonW2Income>tic</_NonW2Income>
  </_NonW2Columns>
</_NonW2Rows>
```

31	32	33	34
	NonW2Income (3;2) tic		NonW2Income tac
NonW2Income	NonW2Income	NonW2Income	NonW2Income
